BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images include but are not limited to the items checked:

☐ BLACK BORDERS
☐ IMAGE CUT OFF AT TOP, BOTTOM OR SIDES
☐ FADED TEXT OR DRAWING
☐ BLURRED OR ILLEGIBLE TEXT OR DRAWING
☐ SKEWED/SLANTED IMAGES
☐ COLOR OR BLACK AND WHITE PHOTOGRAPHS
GRAY SCALE DOCUMENTS
☐ LINES OR MARKS ON ORIGINAL DOCUMENT
☐ REFERENCE(S) OR EXHIBIT(S) SUBMITTED ARE POOR QUALITY
COTHER:

IMAGES ARE BEST AVAILABLE COPY.

As rescanning these documents will not correct the image problems checked, please do not report these problems to the IFW Image Problem Mailbox.

Detail Office Action

Claims 1-25 have been fully reconsidered in light of arguments filed on 5-27-04.

Response to Amendment

Amendments to the abstract warrant the withdrawal of the previous objection.

Amendments to the drawings warrant the withdrawal of the previous objection.

Response to Arguments

Applicant's arguments filed 5-27-04 have been fully considered but they are not persuasive.

Applicant alleges on page 1 of the remarks that neither Chou nor Schneier teach a password comparison at the near end fax machine. Applicant has alleged that Schneier's host on page 54 is the far end. Examiner respectfully disagrees. Schneier's algorithm combined with the fax machine of Chou insists that it is the near end fax machine that would be the host. The host is the entity that controls access. In Schneier's algorithm the host is the near fax and "Alice" would be the far fax. Just because the host initiates the communication does not mean it is the far end. The host controls the communication because it is the entity with the resources in which it is

Art Unit: 2131

protecting. This scheme applied to the fax machines of Chou correlates to the near fax machine with the secret document to first ask the receiver (far) for its password. The term password has many associations in the field of security. In Schneier's algorithm the password is the encryption of a random string which when decrypted by a public key proves knowledge of confidential personal information. Thus authentication of the far side is accomplished. Applicant has interpreted the Schneier teaching in such a way as an attempt to show that Schneier does not teach the comparison of a near end password with a far end password at the near side. Applicant finds this limitation in the combination of Chou and Schneier as discussed above.

Applicant alleges on page 2 of the remarks that neither Chou nor Schneier teach a notification signal upon receipt Examiner respectfully disagrees. Following the protocol on page 54 of Schneier, the host (near end) asks "Alice" (far end) for a password. Alice's rely with the password constitutes a receipt that she received the request signal. This is true because she includes the random string that was just sent by the host to prove that she contains the private key, which corresponds to the public key that the host uses decrypt the response message.

In summary, after further consideration of the prior art in light of Applicant's arguments, Examiner maintains all previous rejections.

Claim Rejections - 35 USC '103

Art Unit: 2131

Claim 1-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Chou et al, herein Chou (USP 5,353,124) in view of Schneier (Applied Cryptography).

As per claims 1, 9,11, 20, and 24, Chou teaches transmitting confidential data over a facsimile transmission whereby the receiver sends his/her password to the sender before a fax is transmitted (column 2, liens 33-35). Chou uses a password to authenticate the receiver so that only the receiver can have access to the fax. Chou teaches that the sender could look up the receiver's personal key to obtain the receiver's identity (column 2, lines 38-41). This equates to a public key. One of ordinary skill in the art would know the use of public and private keys. Chou fails to teach that the sender compares the receiver's password to a local password before sending the fax.

Schneier teaches comparing the received password to a locally computed password in order to authenticate a party (pg 54). Schneier teaches a well-known authentication protocol in which the sender sends a string to the receiver. The receiver then encrypts the string with a private key, which is sent back to the sender (notification of a password request signal). This is synonymous with Chou's teaching of the receiver sending the key back to the sender. Once the sender has the key, the sender decrypts the key with the public key of the receiver, which the sender can look up. Chou teaches this step as well. The sender then compares the received key with the key that was first sent for a match. If a match is found, the sender knows the receiver is trustworthy.

Art Unit: 2131

In view of this, it would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the teaching of Schneier within the system of Chou because Schneier's protocol authenticates the receiver to the sender before any data has been sent to the receiver. This would be advantageous because it would allow the sender to know exactly who is receiving the fax. One skilled in the art would have been motivated to generate the claimed invention with a reasonable expectation of success.

As per claims 2 and 16, Chou teaches the device comprises a facsimile machine (Figure 1, element 12).

As per claims 3 and 17, Chou discloses a system, which comprises a computer like device (column 2, lines 64-68). Chou does not explicitly disclose the use of a PC modern. PC moderns embody the function of a fax machine for computers. Chou discloses a fax machine (Figure 1, element 12). In view of this, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the teachings of Chou and include a PC modern because a PC modern can perform all of the functions that a fax machine performs.

As per claims 4 and 18, Chou teaches the device comprises a chipset (column 2, lines 64-68).

Art Unit: 2131

As per claims 5 and 19, Chou teaches the device comprises a digital signal processor (column 2, lines 60-63).

As per claims 6, 13, and 21, Chou teaches encrypting the confidential information (column 2, lines 45-50).

As per claims 7, 14, and 22, Chou fails to the encryption process is a PGP encryption. Schneier teaches that the PGP encryption process is very secure encryption protocol, which is well suited for ANSI messages (pgs 584-587). The PGP encryption process is much more secure than the encryption process used by Chou. It would be advantageous to improve the level of encryption. In view of this, it would have been obvious to one of ordinary skill in the art at the time the invention was made to employ the teaching of Schneier within the system of Chou because a higher level of encryption would decrease the chance that a malicious user could decrypt the encrypted fax.

As per claims 8, 15, and 23, Chou teaches decrypting confidential information (column 3, lines 25-30).

As per claims 10, 12, and 25, Chou teaches generating a distribution request signal to prompt a far end user to enter distribution instructions (column 3, lines 20-25).

Art Unit: 2131

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael R Vaughan whose telephone number is 703-305-0354. The examiner can normally be reached on M-F 7:30-4:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ayaz Sheikh can be reached on 703-305-9648. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
